

User guide · version 0.4.0

Burnout for Gmail

Reply to email in 3 clicks, with your business's AI

Open an email, click **Reply with Burnout**, check the reply and send it. Your AI writes it your way. You always send it yourself.

Set up in **2 minutes** · **13 clicks** to set up · **3 clicks** per reply · **1 click** with Auto-draft

Open source: github.com/Prepvia/Burnout.v1.0

Disclaimer: Burnout is a free, open-source Chrome extension shared for educational and research purposes. It has no server, and I don't collect, receive or store any of your data. What it saves (your settings, your AI key and what it learns from your emails) stays in your own browser. Your emails go only to the AI provider you choose, under that provider's terms. It never sends an email on its own: you check every draft and click Send yourself. Not made or endorsed by Google or Forbes. Use it at your own discretion.

Bernardo Campelo

October 22, 2026

Before you start

Burnout is real

It is not a bad week or a lazy day. The World Health Organization describes burnout as what happens when stress at work goes on for a long time and is never brought under control. It shows up in three ways:

Exhaustion

You feel drained, with no energy left.

Distance

In your head you pull away from your work, or you feel negative and cynical about it.

Doing less

You feel you can't do your job as well as you used to.

The WHO counts burnout as a work phenomenon, not a disease (ICD-11, 2019). If this sounds like you, talk to a doctor. An app can lighten the inbox, but it is not treatment.

Why I built Burnout

I had burnout. I couldn't answer a single email.

I would open the inbox and my body would lock up. So I decided to build this tool: it reads the email and writes the reply the way I would, and I check it and press Send.

And my new employees learn about the company much faster, from the tips and the drafts.

This is the real deal.

Bernardo Campelo, Forbes Councils E-commerce Group

The name and the logo

Email burns people out. Burnout takes the heavy part: it reads the email, writes the reply your way and remembers what you taught it. You keep the last word: you check it and you send it.

The logo is a lit match: one strike, and the reply is written.

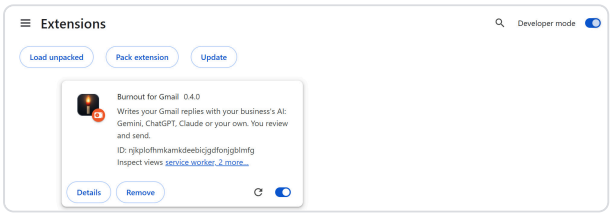

No time?

Try it in 3½ minutes

Four steps, from nothing to your first reply. You need Google Chrome on a computer (Windows or Mac) and Gmail. Burnout is a Chrome extension, a small add-on for Chrome, and doesn't run on phones. No code. The rest of this guide can wait.

1. **Download it.** On Burnout's GitHub page, github.com/Prepvia/Burnout.v1.0, click **burnout-for-gmail.zip** (not *Source code* or the green *Code* button: Chrome can't load those). Unzip it: on Windows, open your Downloads folder, right-click `burnout-for-gmail.zip`, then **Extract All** and **Extract**; on a Mac, double-click it in Downloads. You get a `burnout-for-gmail` folder next to it. Keep it: Chrome runs Burnout from it.

2. **Load it in Chrome.** Type **chrome://extensions** in Chrome's address bar and press Enter (or use Chrome's ⋮ menu: **Extensions**, **Manage Extensions**). Turn on **Developer mode** (top right) and leave it on: Burnout only runs while it's on. Click **Load unpacked**, pick the `burnout-for-gmail` folder (the folder, not the .zip) and click **Select Folder** (**Select** on a Mac).

3. **Connect a free AI.** The setup page opens by itself. Click **Open the key page** and sign in to Google (accept Google's terms if asked). Click **Create API key** and copy the new key (it starts with AQ.). Back in Burnout, paste it (Ctrl+V, or Cmd+V on a Mac) and click **Test and save**. Then type your name, what you do and how you sign off (for example *Best, Alice*), and click **Continue**.

4. **Reply.** In Gmail, open an email with nothing private in it and click Reply with Burnout. Read the reply, click **Put in Gmail**, and send it yourself.

Time	Clicks	Cost	Code
3½ min	**22**	**Free**	**None**
estimated from the counted clicks, from the download to your first reply.	plus typing chrome://extensions and three short boxes.	to try, with Google Gemini's free plan.	you only click, paste and type.

On Gemini's free plan, Google uses what you send to improve its products, and people at Google may read it. Google asks you not to send personal or confidential information there, so try Burnout on an email with nothing private in it. For customer email, turn on billing in Google AI Studio (from $5) or connect another AI (page 15). Stuck? See page 17.

At a glance

What Burnout does

- **Writes your replies.** Open an email and click Reply with Burnout. The reply appears in a panel next to Gmail, in the sender's language, with your name and your signature.
- **Or drafts them for you.** Turn on Auto-draft and, while the panel is open, every email you open already has its reply in Gmail. You check it and click Send.
- **Explains emails.** A summary, what they want from you, and a translation. Or the meaning of one sentence.
- **Learns how you work.** Tell it things to remember, or let it read the emails you already sent.
- **Uses your AI.** Google Gemini (free plan), ChatGPT, Claude, another AI service, or your company's own AI.

Set up	Set-up clicks	Per reply	Per reply
2 min	**13**	**3 clicks**	**~25 s**
with an AI key ready. About 3 minutes if you create a free Gemini key.	4 in Burnout, 9 on GitHub, in your files and in Chrome. No key yet: 17.	Reply with Burnout, Put in Gmail, Send, once the email is open. With Auto-draft, only Send.	from opening the email to sending it.

We counted every click on the shortest way to do each task: an automatic test made the clicks inside Burnout, and we counted the rest by hand. Times are estimates from those counts (page 21).

In this guide

1. Set up p. 5
Install, connect your AI, tell it about your business.

2. Reply to an email p. 8
The 3 clicks, Auto-draft, and the panel from top to bottom.

3. Make the reply better p. 11
One-click changes, your own changes, notes.

4. Understand an email p. 12
Explain, translate, ask questions.

5. Teach Burnout p. 13
Memory, learning from your sent mail, backup.

6. Your AI p. 15
The five choices, and what each one costs.

7. Your data p. 16
What it reads and what it keeps.

8. If something goes wrong p. 17
Messages and fixes, installing included.

9. Make it yours p. 19
Change it with no code, or with an AI's help.

10. Every task, counted p. 21
Clicks and time for each task.

Set up in 2 minutes

Three short steps. The setup page opens by itself after you install Burnout.

Step 1. Install 9 clicks

Burnout is free and open source. You install it yourself, from GitHub.

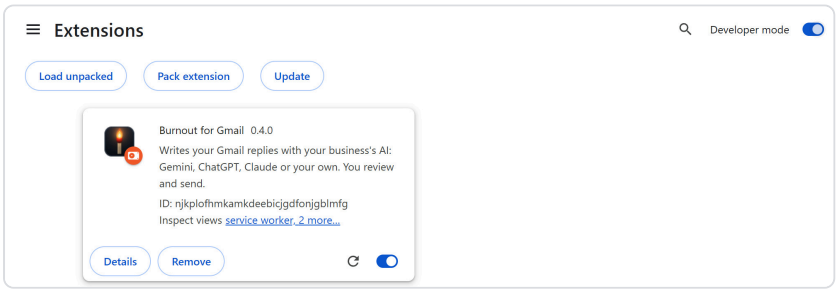

Download it

1. On Burnout's GitHub page, github.com/Prepvia/Burnout.v1.0, click **burnout-for-gmail.zip**. Not *Source code* or *Code, Download ZIP*: those hold the whole project, and Chrome can't load them as they are.
2. Unzip it. On Windows: in Chrome's download list (top right), click the folder icon next to the file (**Show in folder**). Right-click `burnout-for-gmail.zip`, then **Extract All** and **Extract** (a double-click only opens it). On a Mac: double-click it in Downloads (if Safari already unzipped it, the folder is there).

Tip: before you load it, move the `burnout-for-gmail` folder out of Downloads, for example into Documents. Once it's loaded, don't move or rename it: Chrome runs Burnout from it.

Load it in Chrome

1. Open a new tab, type **chrome://extensions** and press Enter. Or use Chrome's ⋮ menu: **Extensions**, **Manage Extensions**.
2. Turn on **Developer mode**, the switch at the top right, and leave it on: Chrome only runs Burnout while it's on.
3. Click **Load unpacked**, pick the `burnout-for-gmail` folder (the folder, not the .zip file) and click **Select Folder** (**Select** on a Mac).

chrome://extensions with Developer mode on, the Load unpacked button, and the Burnout card (the round arrow reloads it).

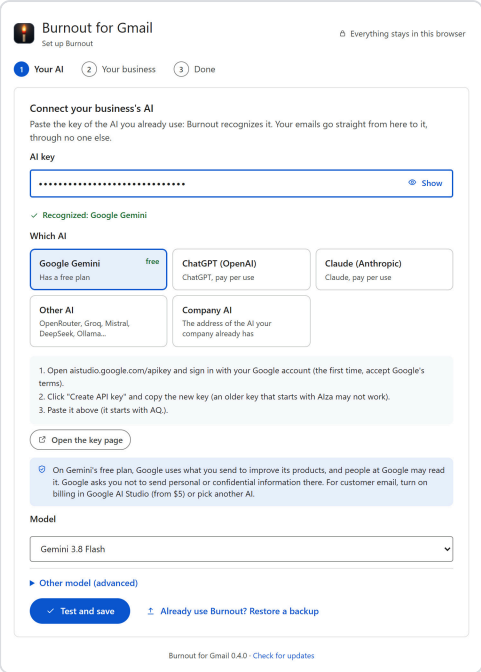

The setup page opens by itself. Keep the `burnout-for-gmail` folder and keep Developer mode on. **To update:** in Settings, Memory, click **Download backup**, just in case. Download the new `burnout-for-gmail.zip` and unzip it. In **chrome://extensions**, click **Load unpacked** and pick the new folder: Burnout updates and keeps your settings and memory. Reload Gmail; a note at the top of the panel says Burnout was updated, and the version is at the bottom of Settings. You can then delete the old folder. Changed a file (page 19)? Make the same change again in the new folder before you load it. Don't copy your old file over: the new version may have changed that file too.

Step 2. Connect your AI 1 click

1. **Press** Ctrl+V to paste (Cmd+V on a Mac)
2. **Click** Test and save

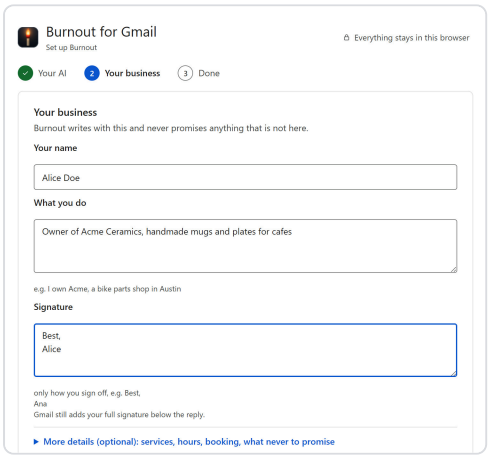

The cursor is already in the key box, so you can paste right away. Burnout sees which AI the key is for and picks it for you.

> **No key yet?**
> Click **Open the key page** and sign in to Google (the first time, accept Google's terms). Click **Create API key** and copy the new key (it starts with AQ.; an older key that starts with AIza may not work). Come back and paste. An API key is a long code that lets Burnout use your AI account: keep it private, like a password. Google Gemini has a free plan. This adds 4 clicks and about 1 minute.

The key was recognized: Google Gemini.

Step 3. Your business 3 clicks

Three boxes. The rest is optional.

1. **Type** Your name (9 letters)
2. **Click** the What you do box
3. **Type** What you do (58 letters)
4. **Click** the Signature box
5. **Type** Signature (11 letters)
6. **Click** Continue

The cursor is already in the name box. Press **Tab** to jump to the next box instead of clicking. In **Signature**, put only how you sign off (for example *Best, Alice*): Gmail still adds your usual signature below the reply.

More details (optional): your services and prices, business hours, booking link, what to never promise, and other email addresses you send from. Burnout only promises what is written here.

Done

Open Gmail and open any email. You will see Reply with Burnout next to the subject.

Set up	Clicks	Time
With an AI key ready	13	about 2 minutes
Creating a free Gemini key	17	about 3 minutes

Clicks include the ones on GitHub, in your files and in Chrome (Load unpacked). Signing in to Google is not counted.

What next

Reply to your first email p. 8
Three clicks, and you send it yourself.

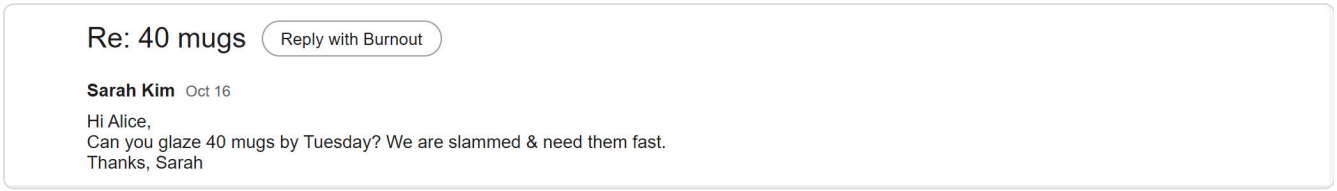

Teach Burnout your business p. 13
Your prices, your rules, and learning from your sent mail.

See what it reads and keeps p. 16
Before you use it on customer email.

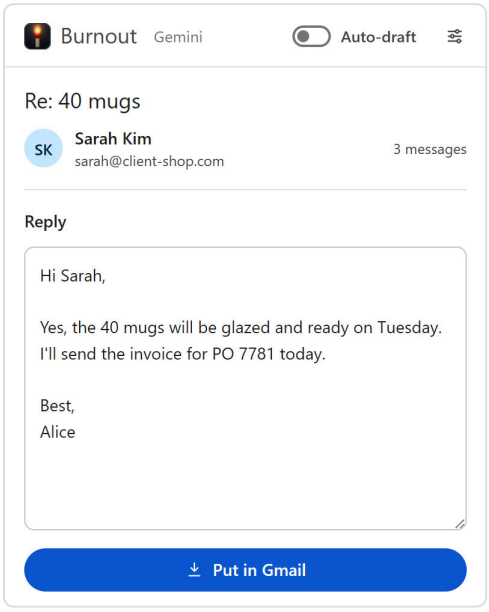

Something didn't work? p. 17
Every message, and what to do.

Reply to an email in 3 clicks

Open the email as usual. Then three clicks. About 25 seconds per email. Or just one with Auto-draft (next page).

The button next to the subject.

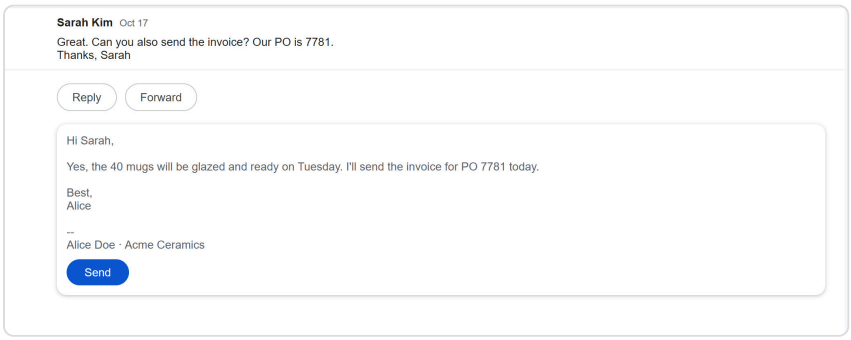

The reply, written your way.

1. **Click** Reply with Burnout next to the subject. The panel opens and the reply appears as it is written.
2. **Read it.** Change anything you want right there, or use the buttons under it (page 11).
3. **Click** Put in Gmail**.** The reply goes into Gmail's reply box, above your signature.
4. **Click Send** in Gmail. That is you sending it. Burnout never sends on its own.

Good to know

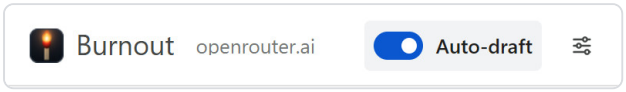

Put it in Gmail again after a change and it replaces the old one. If you edited it in Gmail, or reloaded Gmail since, the new one goes on top: delete the old one below it before you send. If you already opened another email, the reply waits: it never goes to the wrong email. You can also open the panel with **Alt+J** (Option+J on a Mac).

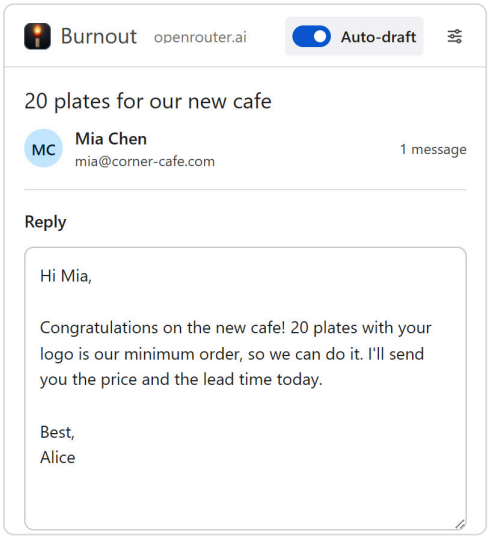

The reply in Gmail, ready to send.

Or one click: Auto-draft

Turn it on once. Then, while the panel is open, every email you open already has its reply in Gmail. The only click left is Send.

The Auto-draft switch, at the top of the panel. Blue means on.

Written the moment the email opened.

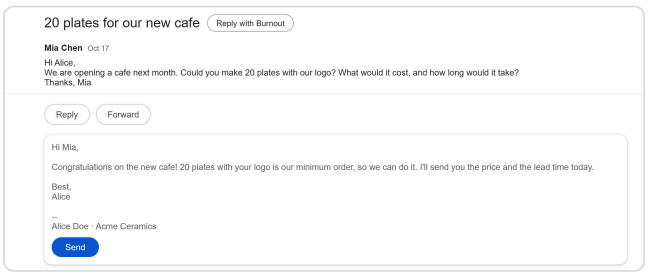

Auto-draft sends every email you open to your AI, even the ones you won't answer. On Gemini's free plan, people at Google may read them. For customer email, turn on billing in Google AI Studio (from $5) or use another AI (page 15) first. A free plan also hits its daily limit sooner. With Gemini, a yellow note reminds you the first time.

1. **Click the Auto-draft switch** at the top of the panel `1 click`. Once: it stays on until you click it again.
2. **Open an email** with the panel open. Burnout writes the reply and puts it in Gmail's reply box as a draft. No clicks.
3. **Read it and click Send.** Burnout still never sends on its own.

When it doesn't write a draft

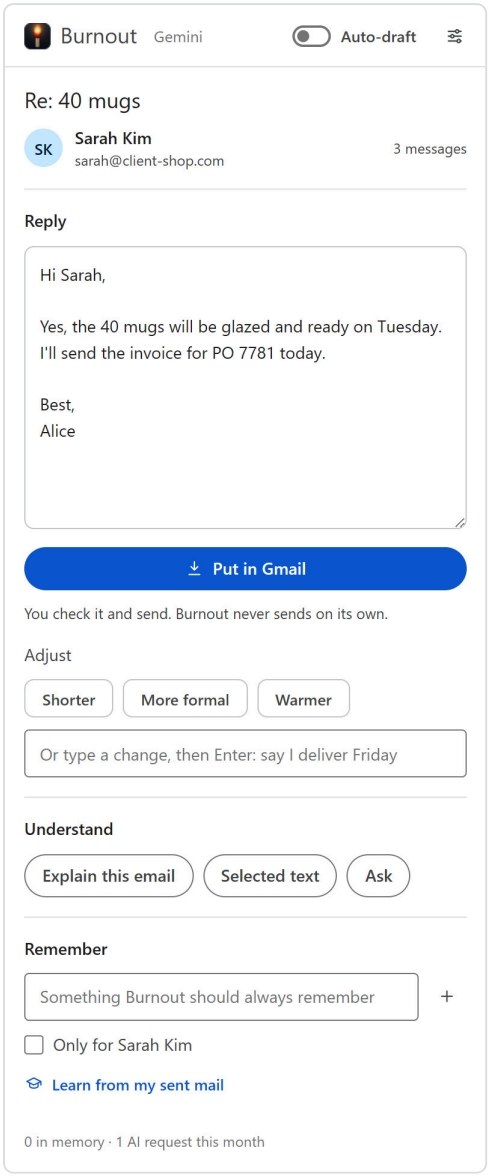

- The panel is closed. Open it with **Alt+J** (Option+J on a Mac).
- You sent the last message: nothing to answer.
- It came from a robot: no-reply@, notifications@, newsletter@ and the like. No draft, no AI used.
- Gmail's reply box was already open. Your text is safe; click Put in Gmail.
- It already drafted this email. A new message drafts it again.

Emails you don't answer keep their draft in Gmail's Drafts: delete the ones you won't send.

Gmail: the draft is in the reply box before you click anything.

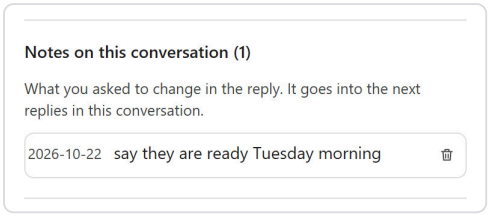

The panel, top to bottom

The panel next to Gmail.

1. **Top bar.** The AI you connected (its name, next to Burnout), the Auto-draft switch, and the sliders icon for Settings.
2. **The email.** Subject, who wrote it, how many messages.
3. **Reply.** The text you will send. Edit it as you like.
4. **Put in Gmail.** The reply goes into Gmail's reply box.
5. **Adjust.** Shorter, More formal, Warmer. Or type your own change and press Enter.
6. **Understand.** Explain this email, Selected text, Ask.
7. **Remember.** Things for Burnout to always keep in mind.
8. **Bottom line.** How much is in memory and how many AI requests you made this month.

Make the reply better

Your own change, saved as a note.

One click 1 click

Click **Shorter**, **More formal** or **Warmer**. The reply is rewritten in a few seconds.

Your own change 1 click

Type what to change, for example *say they are ready Tuesday morning*, and press **Enter**.

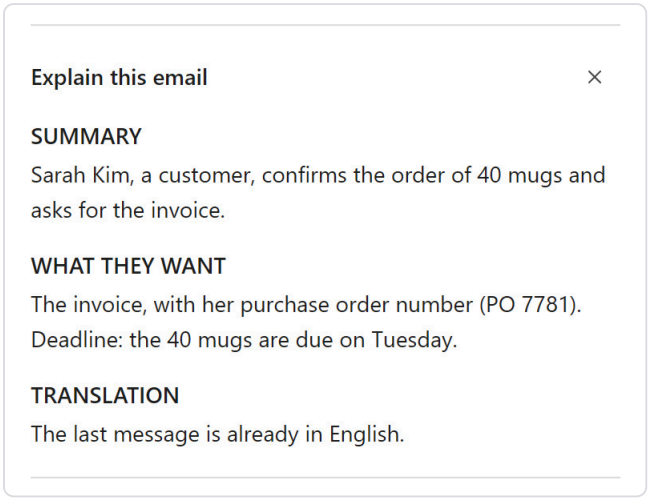

Notes on this conversation

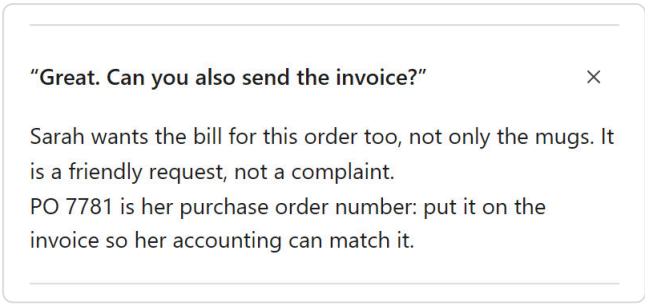

Your own changes are saved as notes for that email thread, with the date, so the next replies remember them. To delete one, click its trash icon 1 click. All notes are also in Settings, Memory.

Two yellow warnings

Check the numbers: the reply has an amount nobody gave (not in the email, your details or your request). **Cut off:** the AI stopped at its length limit.

Understand an email

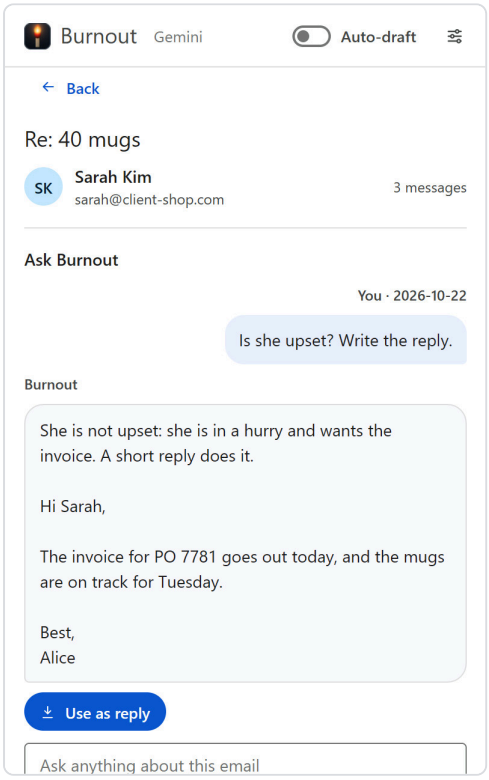

Selected text.

Explain this email.

- **Explain this email** 1 click. A short summary, what they want from you (requests, deadlines, amounts, any pressure), and a full translation of the last message into English.
- **Selected text** 1 click. Select a sentence in the email with your mouse, then click. You get what it means here, and the tone behind it.

Ask, and use the answer as your reply.

Ask 3 clicks

Ask anything about the email: *Is she upset? What should I say?* When you ask for a reply, click **Use as reply**: it goes into the panel's Reply box, ready for Put in Gmail.

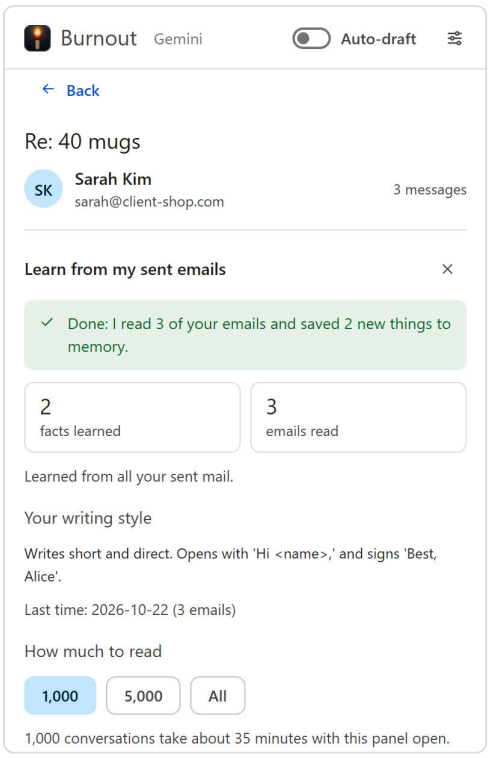

The cursor is already in the question box. Ctrl+Enter (Cmd+Enter on a Mac) sends the question.

Teach Burnout

Remember 2 clicks

Type something in the **Remember** box, for example *Peter handles returns*, and click **+**. It goes into every reply. Tick **Only for** the person (1 more click) to use it only in replies to them.

Learn from my sent mail 2 clicks

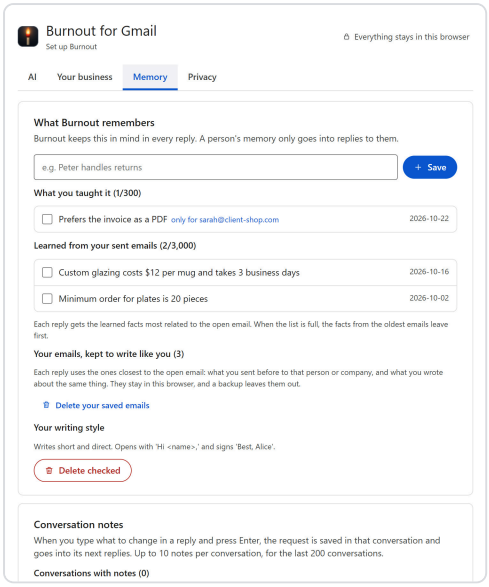

After learning.

Click **Learn from my sent mail**, pick how much to read (1,000 or 5,000 conversations, or **All**) and click **Learn now**. First Burnout goes through your Sent folder: Gmail jumps between searches for a moment, so leave that tab alone. Then it reads and keeps:

- how you write (greeting, length, tone, sign-off);
- facts that repeat: what you offer, prices, how things work;
- a price or deal you gave one customer, only for that customer;
- your own emails, in your Chrome: each reply uses the ones closest to the open email as the model, starting with what you sent before to that person.

Only the messages you wrote go to your AI, not the other side of the conversation. Burnout tells the AI to skip passwords, card numbers and health details, and doesn't save a fact that mentions a password, a PIN or an ID number, or has a card number in it. But your emails still go to the AI as written: on Gemini's free plan, don't use Learn on private mail (the first time, a yellow note at the top of the panel reminds you; close it with ×). It takes about 35 minutes for 1,000 conversations, in a corner of the panel, while you keep working with the panel open. 5,000 or All take hours: stop whenever you want, and **Continue learning** picks up from there. On a paid AI plan, 1,000 conversations cost about $1 on Gemini or $3 on ChatGPT or Claude.

Memory and backup 3 clicks

Settings, Memory.

In **Settings**, **Memory**: everything you taught and everything learned, with dates. Tick and delete what you do not want. The notes of each conversation are here too.

Download backup saves your details, memory, notes, your questions with the AI's answers, and up to three short samples of your sent emails in a file. Keep that file private: it holds pieces of your email. The emails Burnout keeps to write like you stay out of it: on a new computer, run Learn again. To put your AI key in it too, tick **include the AI key** first. On a new computer, install Burnout, click **Already use Burnout? Restore a backup** on the first setup screen and pick the file: Burnout shows what it brings and asks first. Then click Test and save (paste the key if it wasn't in the file).

Your AI, five ways

Burnout has no AI of its own. It uses yours, with your key. Paste a Gemini, ChatGPT or Claude key and it knows which one it is. For any other AI, click Other AI first.

Google Gemini free plan

Get a key at aistudio.google.com/apikey. On the free plan, Google uses the text to improve its products, and people at Google may read it. Turn on billing in Google AI Studio to stop that: you prepay at least $5, then pay per use. (In the EU, the UK and Switzerland, Google applies its paid-plan terms to free use too.)

ChatGPT (OpenAI)

Pay per use, with credit you add to your OpenAI API account (platform.openai.com). A ChatGPT Plus subscription doesn't cover it. OpenAI does not train on it.

Claude (Anthropic)

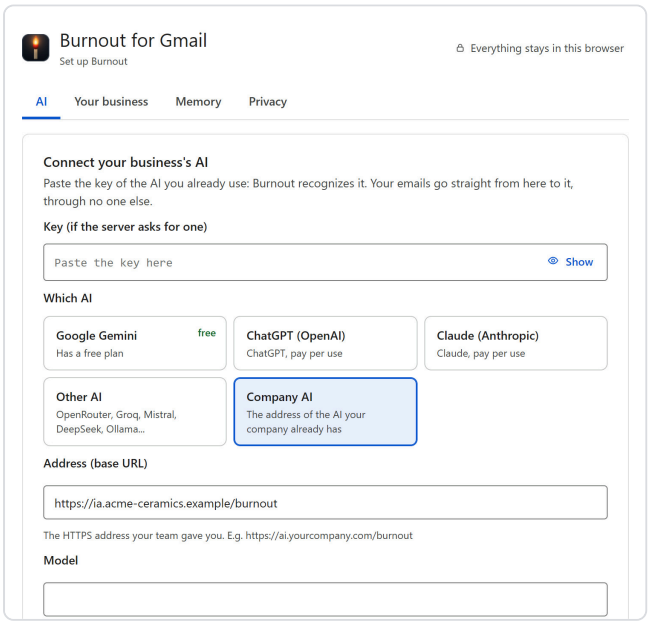

Pay per use, with credit you add to your Anthropic API account (platform.claude.com). A Claude Pro subscription doesn't cover it. Anthropic does not train on it.

Other AI

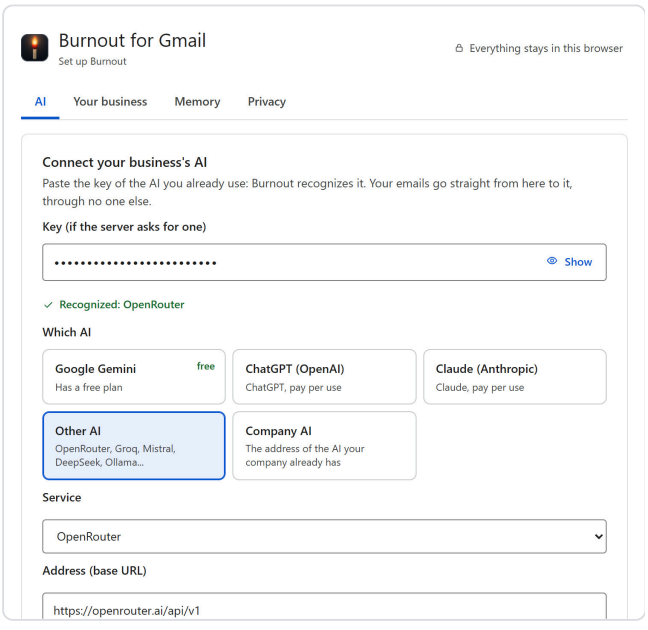

OpenRouter, Groq, Mistral, DeepSeek, xAI, Together, or a model on your own computer (Ollama, LM Studio). Click Load models and pick one.

Your company's AI

The web address of the AI your company already runs. Your IT team sets it up once (last page).

Company AI: 5 clicks.

Other AI (OpenRouter): 6 clicks.

Your data

There is no Burnout server. Everything stays in your Chrome.

- **What it reads:** the email you open, while the panel is open, to show it in the panel. It goes to your AI only when you click a button, or as soon as you open it while Auto-draft is on. Your sent emails, only when you click Learn, and only the messages you wrote go to your AI.
- **Where it goes:** straight from your Chrome to the AI you chose. Nowhere else: not even I receive your emails.
- **What it keeps, in your Chrome:** your AI key, your details, your memory, the notes and questions for each conversation, this month's request count, and your own sent emails it learned from (your part only, to write like you). Not your inbox, and nobody else's emails. Settings, Memory deletes your saved emails.
- **What it never does:** send, delete or change any email.
- **Delete everything:** Settings, Privacy, **Delete everything in Burnout**. Removing the extension also deletes it all.

Built-in safety

Emails are treated as text, never as orders: Burnout tells the AI to ignore instructions written inside an email, and to point them out when you click Explain. Most text an email hides from you (invisible, tiny, see-through or white on white) is removed before it reaches the AI. Burnout tells the AI to take prices, dates and discounts only from the email, your details or your request, and shows **Check the numbers** when an amount appears that nobody gave. A backup file can't connect Burnout to an AI by itself: you check it and click Test and save. Always read before you send. The security review is in SECURITY.md, on Burnout's GitHub page, github.com/Prepvia/Burnout.v1.0.

If something goes wrong

While installing

- Chrome says **Failed to load extension, Manifest file is missing or unreadable**? You picked the wrong folder, or you downloaded *Source code*. Click **Cancel**, then **Load unpacked** again and pick the `burnout-for-gmail` folder, the one with `manifest.json` inside (Windows may show it as just *manifest*). Not the .zip file, and not the folder above it.
- Burnout disappeared, or its card says **Turn on developer mode to use this extension**? Developer mode got turned off. Turn it back on at the top right of **chrome://extensions**: Burnout comes back with your settings.
- No Developer mode switch, it's greyed out, or Chrome says **Loading of unpacked extensions is disabled by the administrator**? Your company manages this Chrome. Ask your IT person, or use Chrome on a computer you manage yourself.
- Google's key page says you can't use AI Studio with this account? Your Google Workspace admin may have turned it off. They can turn it on in the Google Admin console (Apps, Additional Google services, AI Studio), or you can create the key with a personal Gmail account.

The panel says	What to do
The AI key didn't work. Check that you copied all of it, in settings.	Copy the key again from the AI's website, all of it, and click Test and save.
Google didn't accept the key. Copy it again, all of it. An old Gemini key (starting with AIza) may no longer work: make a new one with Open the key page in settings.	In Settings, AI, click Open the key page, make a new key, paste it and click Test and save.
The key has an odd character (maybe the hidden version, with •••). Copy it again, all of it.	Copy the key again. The hidden version (with dots) does not work.
Your AI account is out of credit. Add credit on the AI's website (Billing) and try again. A ChatGPT or Claude subscription doesn't include API credit.	Add credit on the AI's website (Billing). A ChatGPT or Claude subscription doesn't include it: the API is paid separately.
Your AI hit its request limit. Wait a minute and try again. If it keeps happening, today's free requests may be used up: on Gemini's free plan they come back after midnight Pacific time, and Auto-draft uses one for each email you open.	Wait a minute and try again. To save requests, turn Auto-draft off, or turn on billing for your AI.
That model isn't available on your account. Pick another one in settings.	Pick another model in Settings, AI.
Chrome didn't allow talking to the AI. Click Test and save again and accept.	Click Test and save again, and click Allow when Chrome asks.

The panel says	What to do
Couldn't reach the AI at that address. Is the server on?	Turn the server on (Ollama, LM Studio) or check the address.
Couldn't read this email. Reload Gmail and try again.	Reload Gmail and try again.
Gmail was already open when Burnout was installed. Reload the page so it can see your emails.	Reload the Gmail tab once, right after installing.
You opened another email. Go back to this reply's conversation to put it in Gmail.	Go back to the email the reply is for.
Couldn't find the reply box. I copied the text: paste it in Gmail with Ctrl+V.	Paste the reply with Ctrl+V (Cmd+V on a Mac).
Check the numbers: there is an amount that is not in the email, your profile or your instruction.	Check the amount before sending, or add your prices to Your business.
The AI stopped at its length limit: the end may be cut off. Use Shorter, or type what to change.	Click Shorter, or type what to change and press Enter.

Make it yours

Burnout is open source: every file is yours to change. Most changes need no code at all.

Without touching a file

You want	Where
Replies that sound like you	Settings, Your business: what you do and your signature. Then **Learn from my sent mail** in the panel.
Your prices, hours, booking link, what to never promise	Settings, Your business, **More details**.
A fact it must always use	**Remember** in the panel, or the Memory tab in Settings.
Another AI, or your company's own	Settings, AI (chapter 6).
Drafts already waiting in Gmail	The **Auto-draft** switch at the top of the panel.

Change the files, with an AI's help

For what Settings can't do: other words on a button, other colors, new rules for how it writes. (Your tone is already in Settings: Your business, More details, Writing style.) You don't need to know code. Only use changes you asked an AI for yourself, never files someone sends you: Burnout can read your Gmail.

1. **Back up first:** Settings, Memory, **Download backup**. Then make a copy of the `burnout-for-gmail` folder, so you can always go back.
2. **Open the file** for what you want to change (tables below): right-click it, then **Open with**, **Notepad** (on a Mac: right-click, **Open With**, **TextEdit**). On Windows, don't double-click a .js file: Windows tries to run it.
3. **Ask an AI** such as Claude or ChatGPT: paste the whole file and say what you want (recipes below). Ask it to send back the complete file, with nothing left out. If its answer is clearly shorter than the file you pasted, or says something like "rest unchanged", ask again.
4. **Paste it over the old text:** back in Notepad, select all (Ctrl+A, or Cmd+A on a Mac), paste the new file and save (Ctrl+S, or Cmd+S).
5. **Reload.** In **chrome://extensions**, click the round arrow on Burnout's card, then reload Gmail. Never click **Remove**: it deletes your settings and memory.

Something broke? Copy the file you changed from your copy back into the `burnout-for-gmail` folder, choose Replace, and click the round arrow again. Keep using the original folder: don't load the copy in Chrome. An update replaces the files you changed, so keep a note of what you asked for.

Three ready recipes

To change	File	What to ask the AI
A button's words	`lib/i18n.js`	*This is i18n.js from my Chrome extension. Change only the text "Put in Gmail" to "Insert reply". Keep everything else exactly the same, including quotes, commas and brackets. Send back the complete file.*
Your brand color	`ui.css`, then `content.css`	*This is ui.css from my Chrome extension. Change only the blue colors (#2D8CFF and its lighter shades) to my brand color #E4572E, with matching lighter shades. Keep everything else exactly the same. Send back the complete file.* Then the same for content.css, the button inside Gmail.
Explanations in your language	`lib/prompts.js`	*This is prompts.js from my Chrome extension. Make Explain, Selected text and Ask answer me in Portuguese instead of English. Change only the words that set that language. Keep everything else exactly the same. Send back the complete file.*

Which file does what

`lib/prompts.js` means the prompts.js file inside the lib folder.

File	What it holds
`lib/prompts.js`	How Burnout writes: the instructions it sends to the AI.
`lib/i18n.js`	The words in the panel and in Settings, the name at the top of the panel included.
`_locales/en/messages.json`	The name, and the button in Gmail (Reply with Burnout).
`ui.css`	The colors, sizes and spacing of the panel and of Settings.
`content.css`	The look of the Reply with Burnout button inside Gmail.
`icons/`	The logo: four square pictures, icon16.png, icon32.png, icon48.png and icon128.png (16, 32, 48 and 128 pixels). Replace them with yours, same names.
`lib/ai.js`	How it talks to each AI. Leave this one to a developer.

Every task, counted

An automatic test did every task inside Burnout the shortest way and counted each click. The clicks outside Burnout (on GitHub, in your files, on Google's page, in Chrome and in Gmail) follow the same shortest path, counted by hand, and are in their own column.

Task	Clicks in Burnout	Other clicks	Typing	About how long
Download it the ready ZIP, then unzip	0	5		about 30 seconds
Load it in Chrome Developer mode, Load unpacked	0	4	19 letters	about 35 seconds
Get a free Gemini key (only if you have none) on Google's page	1	3		about 1 minute
Connect your AI paste the key, Test and save	1	0	paste	about 15 seconds
Tell it about your business name, what you do, signature	3	0	78 letters	about 40 seconds
Reply to an email open it, Reply, Put in Gmail, Send	2	2		about 25 seconds
Turn Auto-draft on or off the switch at the top of the panel	1	0		about 5 seconds
Reply with Auto-draft on open it, Send	0	2		about 20 seconds
Make the reply shorter, more formal or warmer	1	0		about 10 seconds
Ask for your own change type it, press Enter	1	0	34 letters	about 20 seconds
Explain and translate an email	1	0		about 20 seconds
Explain a sentence select it, then click	1	0		about 15 seconds
Ask a question and use the answer	3	0	30 letters	about 30 seconds
Remember something +1 click for only one person	2	0	28 letters	about 15 seconds
Delete a note	1	0		about 5 seconds
Learn from your sent mail runs in a corner	2	0		about 35 minutes
Download a backup	3	0		about 10 seconds
Switch to your company's AI	4	1	40 letters	about 30 seconds
Switch to another AI (e.g. OpenRouter)	5	1	paste	about 25 seconds
Open the panel Alt+J	0	0	Alt+J	about 5 seconds

How we estimated time

2.5 seconds per click (find it and click it), 0.3 seconds per letter typed, 1.0 second per key press (paste, Enter), plus the time to read a screen or wait for the AI (a few seconds), and 45 seconds on Google's page to create a key. The test typed a 9-letter name, a 58-letter description and a short signature: with longer texts, setup takes a little longer.

For your IT team

Connect your company's AI

Choose **Company AI** in Settings and paste the address of your AI. For each request, Burnout sends this and expects the text back.

```
POST <address>
Content-Type: application/json
Authorization: Bearer <key>        (only when there is a key)

{
  "system": "the rules and your business profile",
  "prompt": "the email and the request",
  "max_tokens": 1500,
  "purpose": "reply | fast | learn",
  "model": "whatever is in the Model field"
}

Response (JSON): { "text": "the reply text" }
"output", "content", "response" or plain text also work.
```

- **purpose**: `reply` (writing or changing a reply; the person is waiting), `fast` (explain, ask, test) or `learn` (learning from sent mail; can take longer). Answer within 60 seconds (120 for learn, 30 for the Test and save check).
- HTTPS only. `http://localhost` works for a model on the same computer.
- `max_tokens` goes from 20 to 4000, depending on the task (Learn asks for 4000): don't cap it lower.
- Errors: 401/403 means the key was refused, 402 no credit, 404 wrong address, 429 too many requests, 5xx down. No CORS setup is needed. If your server checks the Origin header, allow `chrome-extension://` origins.
